Experience

Production Support Engineer (Analyst)

June 2025 – Present

Accommodations Plus International (API)

Markham, ON

- Supported critical production services by diagnosing issues across Java services, messaging layers, and database interactions to maintain reliable data flow between interconnected systems.
- Monitored production health using Datadog and AWS CloudWatch, analyzing logs, Lambda execution behavior, and SQS/DLQ message flow to detect anomalies and prevent customer-impacting failures.
- Investigated application and infrastructure issues in Linux environments using log analysis, process monitoring, and shell-based diagnostics to identify root causes of production failures.
- Participated in on-call support for high-priority production incidents, investigating cloud infrastructure and application workflows to identify issues and restore service within business-critical timelines.
- Wrote and executed SQL queries to analyze, validate, and correct application data, resolving backend issues that impacted downstream processes and user-facing functionality.
- Reduced recurring incidents by 20% through systematic root cause analysis, contributing code-level fixes and architectural recommendations directly to engineering teams.
- Partnered with developers during releases to validate fixes, reproduce edge-case bugs, and ensure safe deployment of production changes under tight SLAs.

Full Stack Developer / Consultant

Jan 2024 – Jan 2025

Covetus

Dallas, Texas (Remote)

- Developed backend services and API integrations supporting user activity tracking, collaboration workflows, and secure data exchange between application components.
- Designed RESTful APIs using Java and Spring Boot, implementing JWT authentication and role-based access controls to secure application endpoints.
- Implemented input validation, exception handling, and business-rule checks to improve data integrity and prevent invalid transactions.
- Wrote SQL queries to retrieve, modify, and validate application data while investigating database issues that affected frontend behavior and user workflows.
- Built frontend integrations with React and JavaScript, ensuring secure session handling, consistent API communication, and validated user input across the UI layer.
- Wrote unit and integration tests for core services and contributed to code reviews to improve release quality and reduce regressions.
- Worked in an Agile development environment using Git, Jira, Postman, and CI/CD pipelines while collaborating across frontend and backend teams.

Technical Consultant

May 2022 – Dec 2023

Link Infotech Inc.

Toronto, ON

- Implemented backend services and internal tooling in Python and Flask, designing secure APIs with least-privilege access patterns and token-based authentication for internal data workflows.
- Authored Bash and Python automation scripts for deployment, log rotation, and system health monitoring — reducing manual ops overhead and improving incident detection time.
- Built log aggregation and alerting pipelines using Splunk to surface system anomalies and support proactive incident response across internal infrastructure.
- Collaborated with infrastructure and development teams to troubleshoot production issues and maintain system stability.
- Enforced secure coding standards through structured Git/GitHub code review workflows, covering error handling, input validation, and compliance with cybersecurity audit requirements.

Education

York University

Honours Bachelor of Science in Computer Security

Toronto, Ontario

Technical Skills

Languages: Java, Python, SQL, JavaScript

Backend: Spring Boot, Spring, Hibernate (ORM), ActiveMQ, REST APIs, Microservices

Testing & Debugging: JUnit, API testing (Postman), log analysis, root cause analysis

Cloud & DevOps: AWS (EC2, S3, Lambda, DynamoDB), CI/CD, Docker

Databases: PostgreSQL, Oracle, MySQL, MongoDB

Tools: Git, Jira, Linux, Confluence

Methodologies: Agile (Scrum), SDLC
